

Problem:

My FX-PCT 5.3 install will not complete, it gets stuck on a reboot request.

The install will tell me to reboot the PC, then it will do it again after each reboot.

NOTE: This issue has also been found in FX-PCT versions 6.0 and 10.0.

Error Message:

A pending system reboot was detected. Please reboot the PC and run setup again.

Cause:

The PCT install monitors a registry key (HKLM\system\currentcontrolset\control\session manager:PendingFileRenameOperations) that Windows uses to determine when a reboot is needed.

Solution:

Reboot the machine, if you have not already.

If you have already rebooted, then you can run the PCT installation with the following command line to ignore the reboot message. If you have installed from a CD, then copy the files from your CD to your PC.

Run the DOS command, referencing the folder with the setup files, and use the path below ending in zero.

```
setup.exe /vREBOOTCHECK=0
```

There are no spaces between /v and REBOOTCHECK=0.

Keywords:

FX-PCT PCT install installation reboot detected pending system DOS ignore 5.3 repeat
